

Atmospheric neutrino anomaly:

- Atmospheric neutrino problem.
 - Explanation of their results.
 - Kamikande results.

Solar neutrino anomaly:

- Solar neutrino problem.
 - Explanation of their results.
- Why number of event is plotted against polar angle not azimuthal angle?
 - The thing is here the question is not correct. The angles are zenith and azimuthal angles. We prefer zenith angle because it gives an estimate of the baseline.

Experiment & Analysis:

- Importance of L/E ratio to probe different oscillation parameters.
- What are the differences between phase space and parameter space while talking about the sensitivity plot.
- How to compare results from different experiments?
- Does NOvA event simulation consider event by event basis or as sum of all events (i.e. cumulatively)?
- Does off-axis configuration affect beam backgrounds?
 - Yes, it helps to reduce the beam background as well (comment by - **Prof. Srubabati Goswami**)

- Oscillograms are not periodic, from which non periodicity comes from? (by - **TND**)
 - This non periodicity comes from Δm^2 i.e. mass square difference.

Have to add what HEP has given to humanity.

Also have to add what neutrino oscillation can give to humanity.
